## Chapter 1

## Introduction

In the following part firstly the problem will be explained and secondly the requirements for a basic plotter will be enlisted. A plotter is a program that can plot functions from strings which defines the functions by ordinary math syntax. This project uses C++ programming language and a the gtkmm<sup>1</sup> wrapper for the GTK+<sup>2</sup> toolkit to generate the graphical user interface. It is compiled with the GNU gcccompiler.

### 1.1 Requirements

A few basic things is needed to have a functioning math plotter:

- 1. Define a function given ordinary math syntax.
- 2. Parse the inputed function and plot it accordingly.
- 3. Add/Remove functions from plotarea.
- 4. Plotarea should be scrollable both vertical and horizontal.
- 5. Range should be fixed to the unit-cube.<sup>3</sup>
- 6. Display axis of the plot.
- 7. Parser must be properly tested.

## 1.2 Scope

The amount of functionality that is possible to put in a system like this is almost endless so a few delimitations has to be made in order to complete the project. The

<sup>&</sup>lt;sup>1</sup>Documentation, binaries and source can be found at: www.gtkmm.org

<sup>&</sup>lt;sup>2</sup>Documentation, binaries and source can be found at: www.gtk.org

<sup>&</sup>lt;sup>3</sup>This restriction will be handled in section 1.2

currently biggest restriction to the plotter is the lack of ability to zoom or change the range from the unit-cube. No support for parametric nor complex functions.  $^4$ 

### 1.3 Assistance

<sup>&</sup>lt;sup>4</sup>Since no native support in C++ for complex numbers which means all the basic math functions would have to be rewritten in order for this to work.

## Chapter 2

## **Structure**

An basic overview can be seen in figure 2.1

#### 2.1 Parser

The parser code can be divided into to parts the algorithm code, that is the actual parser, and the data structure in the form of a parse tree in which each node has iexpression as baseclass.

TODO order all sections/subsections in descending order of importance (tex. parse should be placed first)

#### **2.1.1** parser

<br/><br/>basic description of the class> <example of a parse tree, with all the different<br/>components like pharantehsis and funcionts, binary and unary operators. and how<br/>they are really handled in the parsing>

parse(expr : std::string):iexpression\* test TODO make it look like a doxygen
(and remove the compileerror)

**Public** 

Argument: expr blabla

Return iexpression\*

Public <br/> <br/> description of the function> TODO should i perhaps move the arguments/return as i doxygen to their own posts?

parse\_exception

operators

#### 2.1.2 unary\_level

what is this used for?

## 2.1.3 iexpression...

### 2.2 Plotter

 $\dots$  <images with the different parts highlighted with a red border, that is the parts being described at the moment> especially point out the inheritance in the custom widgets.

#### 2.2. PLOTTER

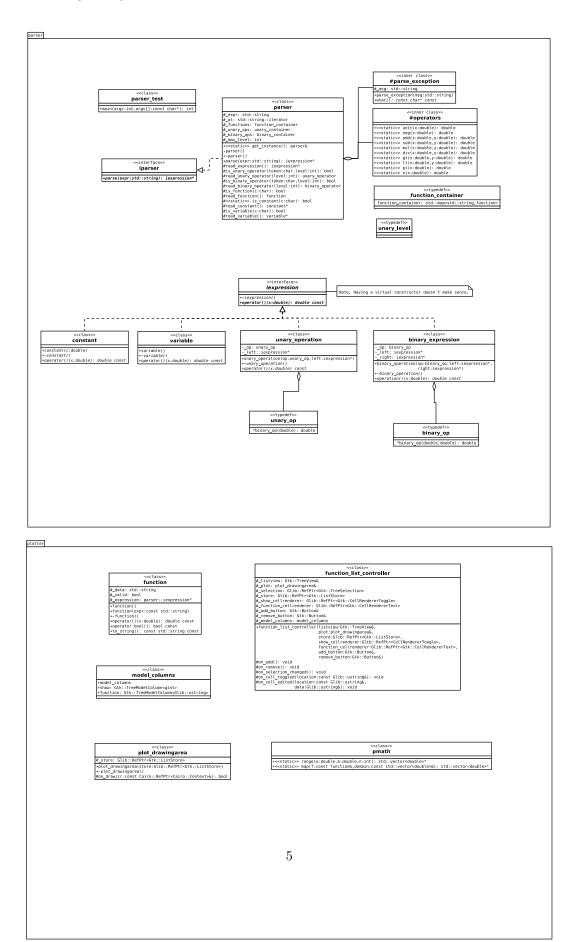

Figure 2.1. An UML showing the structure and the enclosure.

# Chapter 3

# **Results and Discussion**

### 3.1 Results

«screenshots» Runned trough valgrind, results?.

### 3.2 Discussion

Problems with the unofficial C++wrapper gtkmm, only used it to avoid missing out inheritance, polymorphism and to get it compatible with the standard C++Library.
